

# Foes or Friends: Embracing Ground Effect for Edge Detection on Lightweight Drones

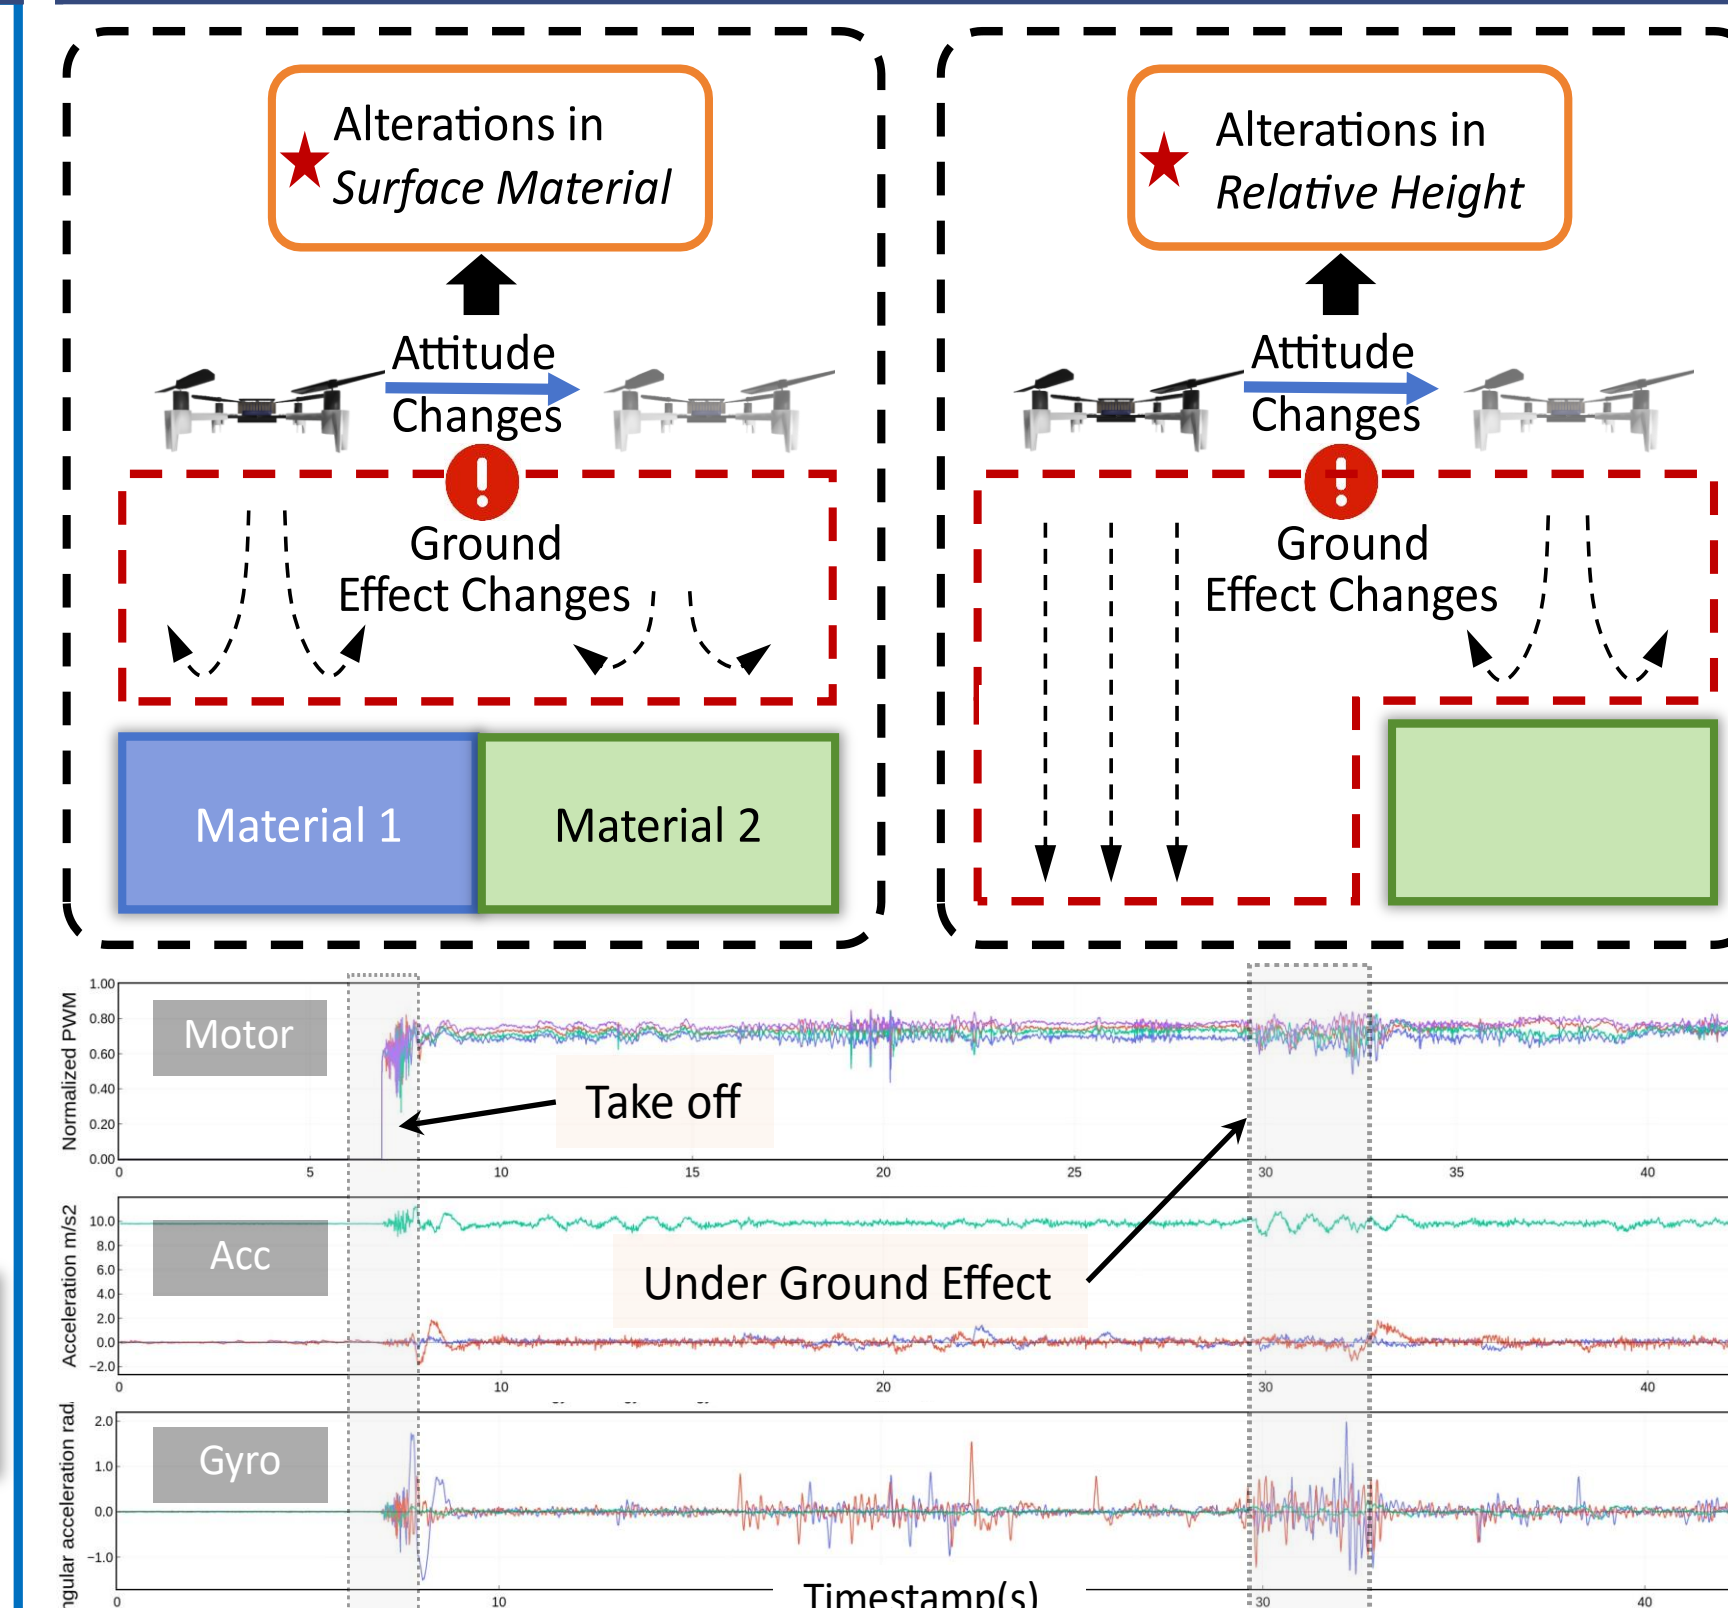

## Abstract

- **Goal:** Develop a new sensing modality for light-weight drone for rapid and accurate edge detection with minimum number and lowest-level sensors, for delivery precise landing, mobile terrain mapping in agriculture, etc.
- **Research Question:** How can ground effect be turned into a new sensing modality for accurate edge detection?
- **Challenge:** Target discrepancy between sensing and flight control complicates ground effect profiling. Noisy sensing data overwhelms vital feedback related to ground effect.
- **Novelty:** Transforming a “foe” to a “friend”: a new sensing modality for edge detection. Implementing the system with a light-weight model on edge computing device.

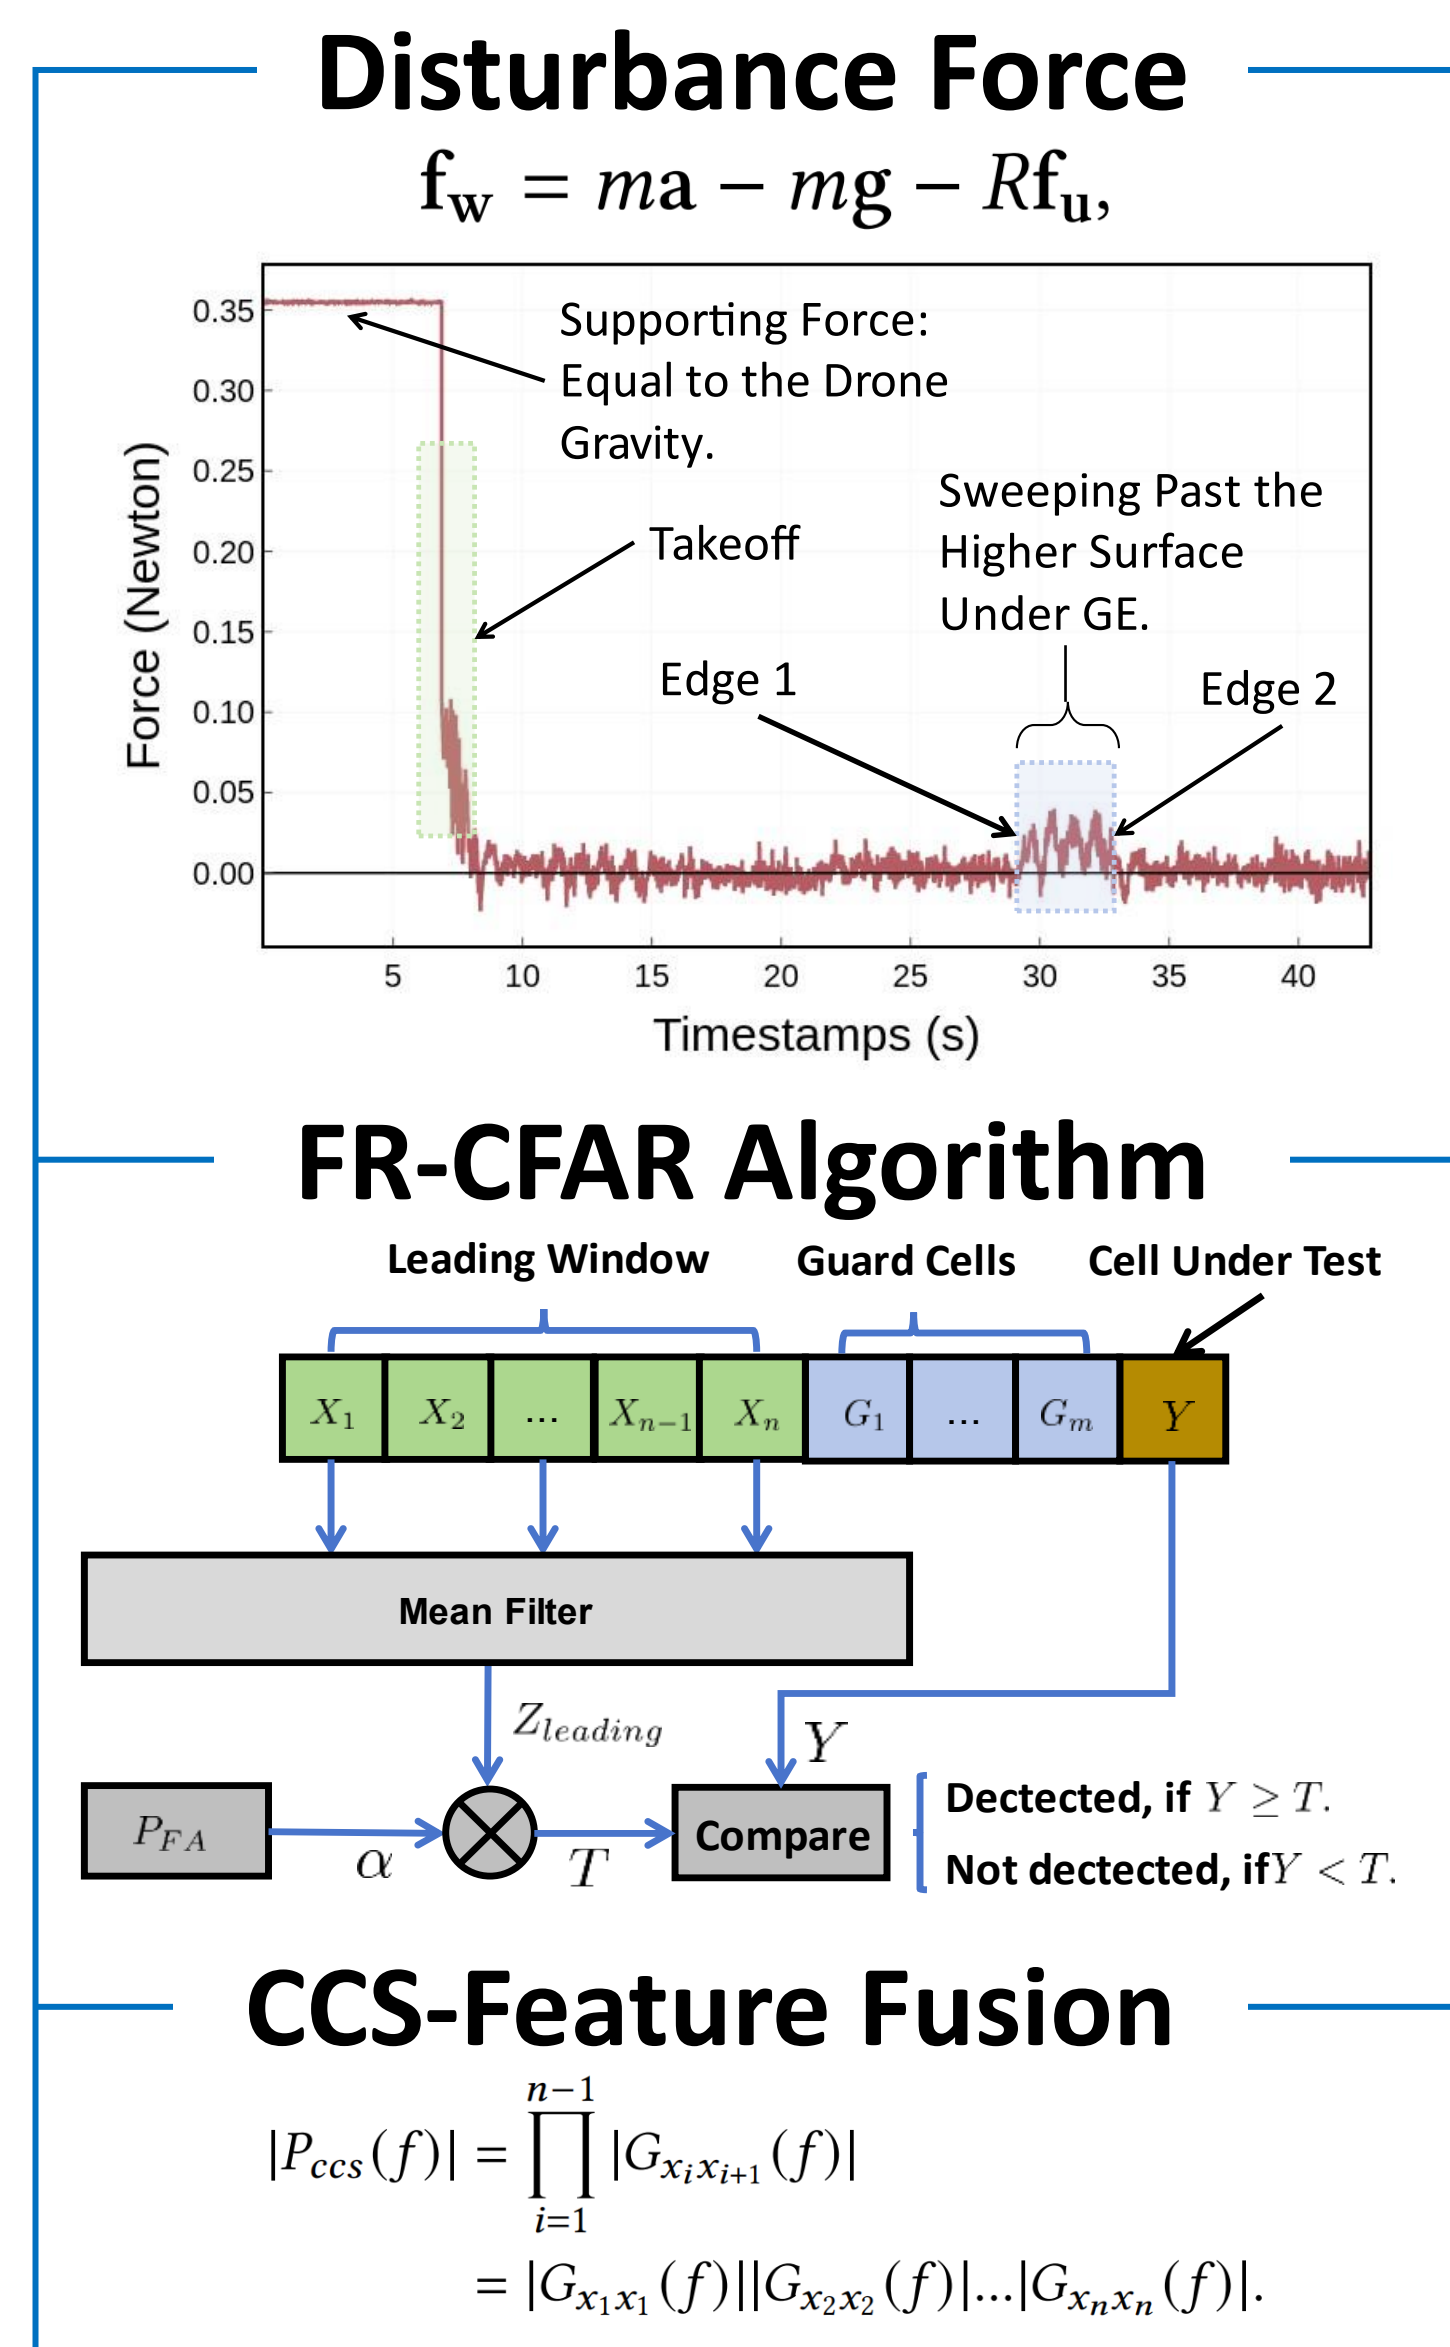

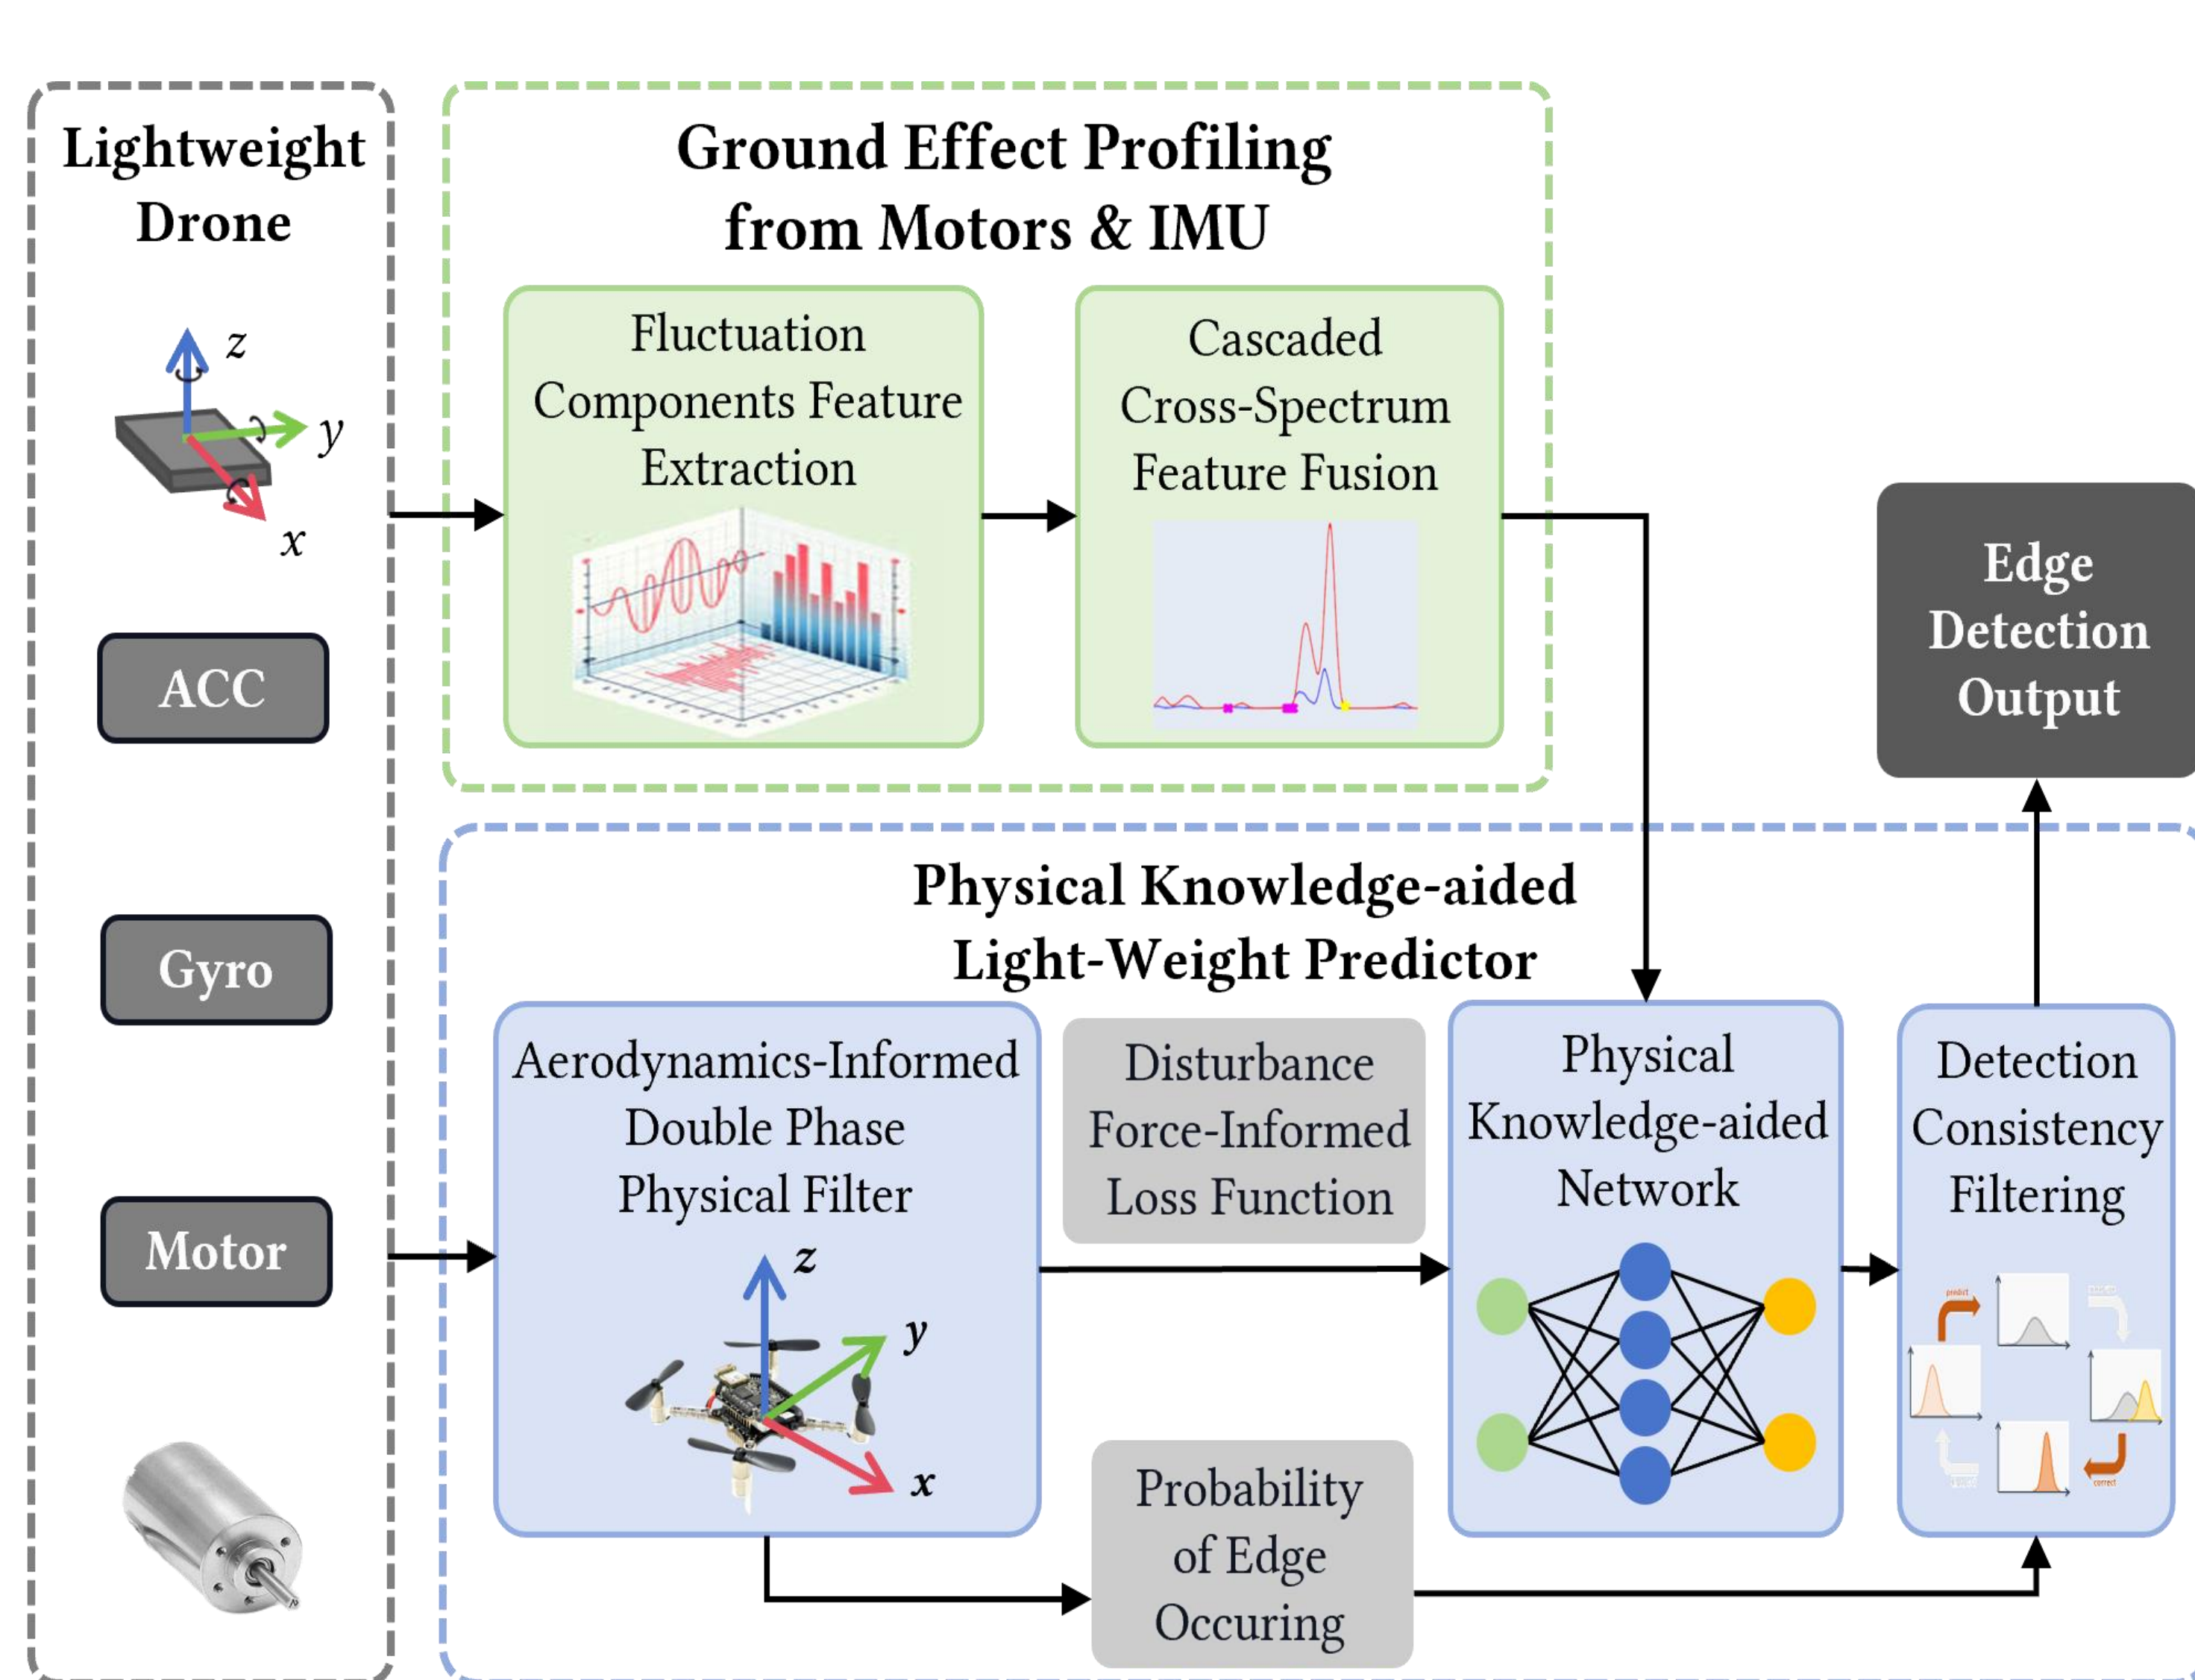

## Motivation

## Insight

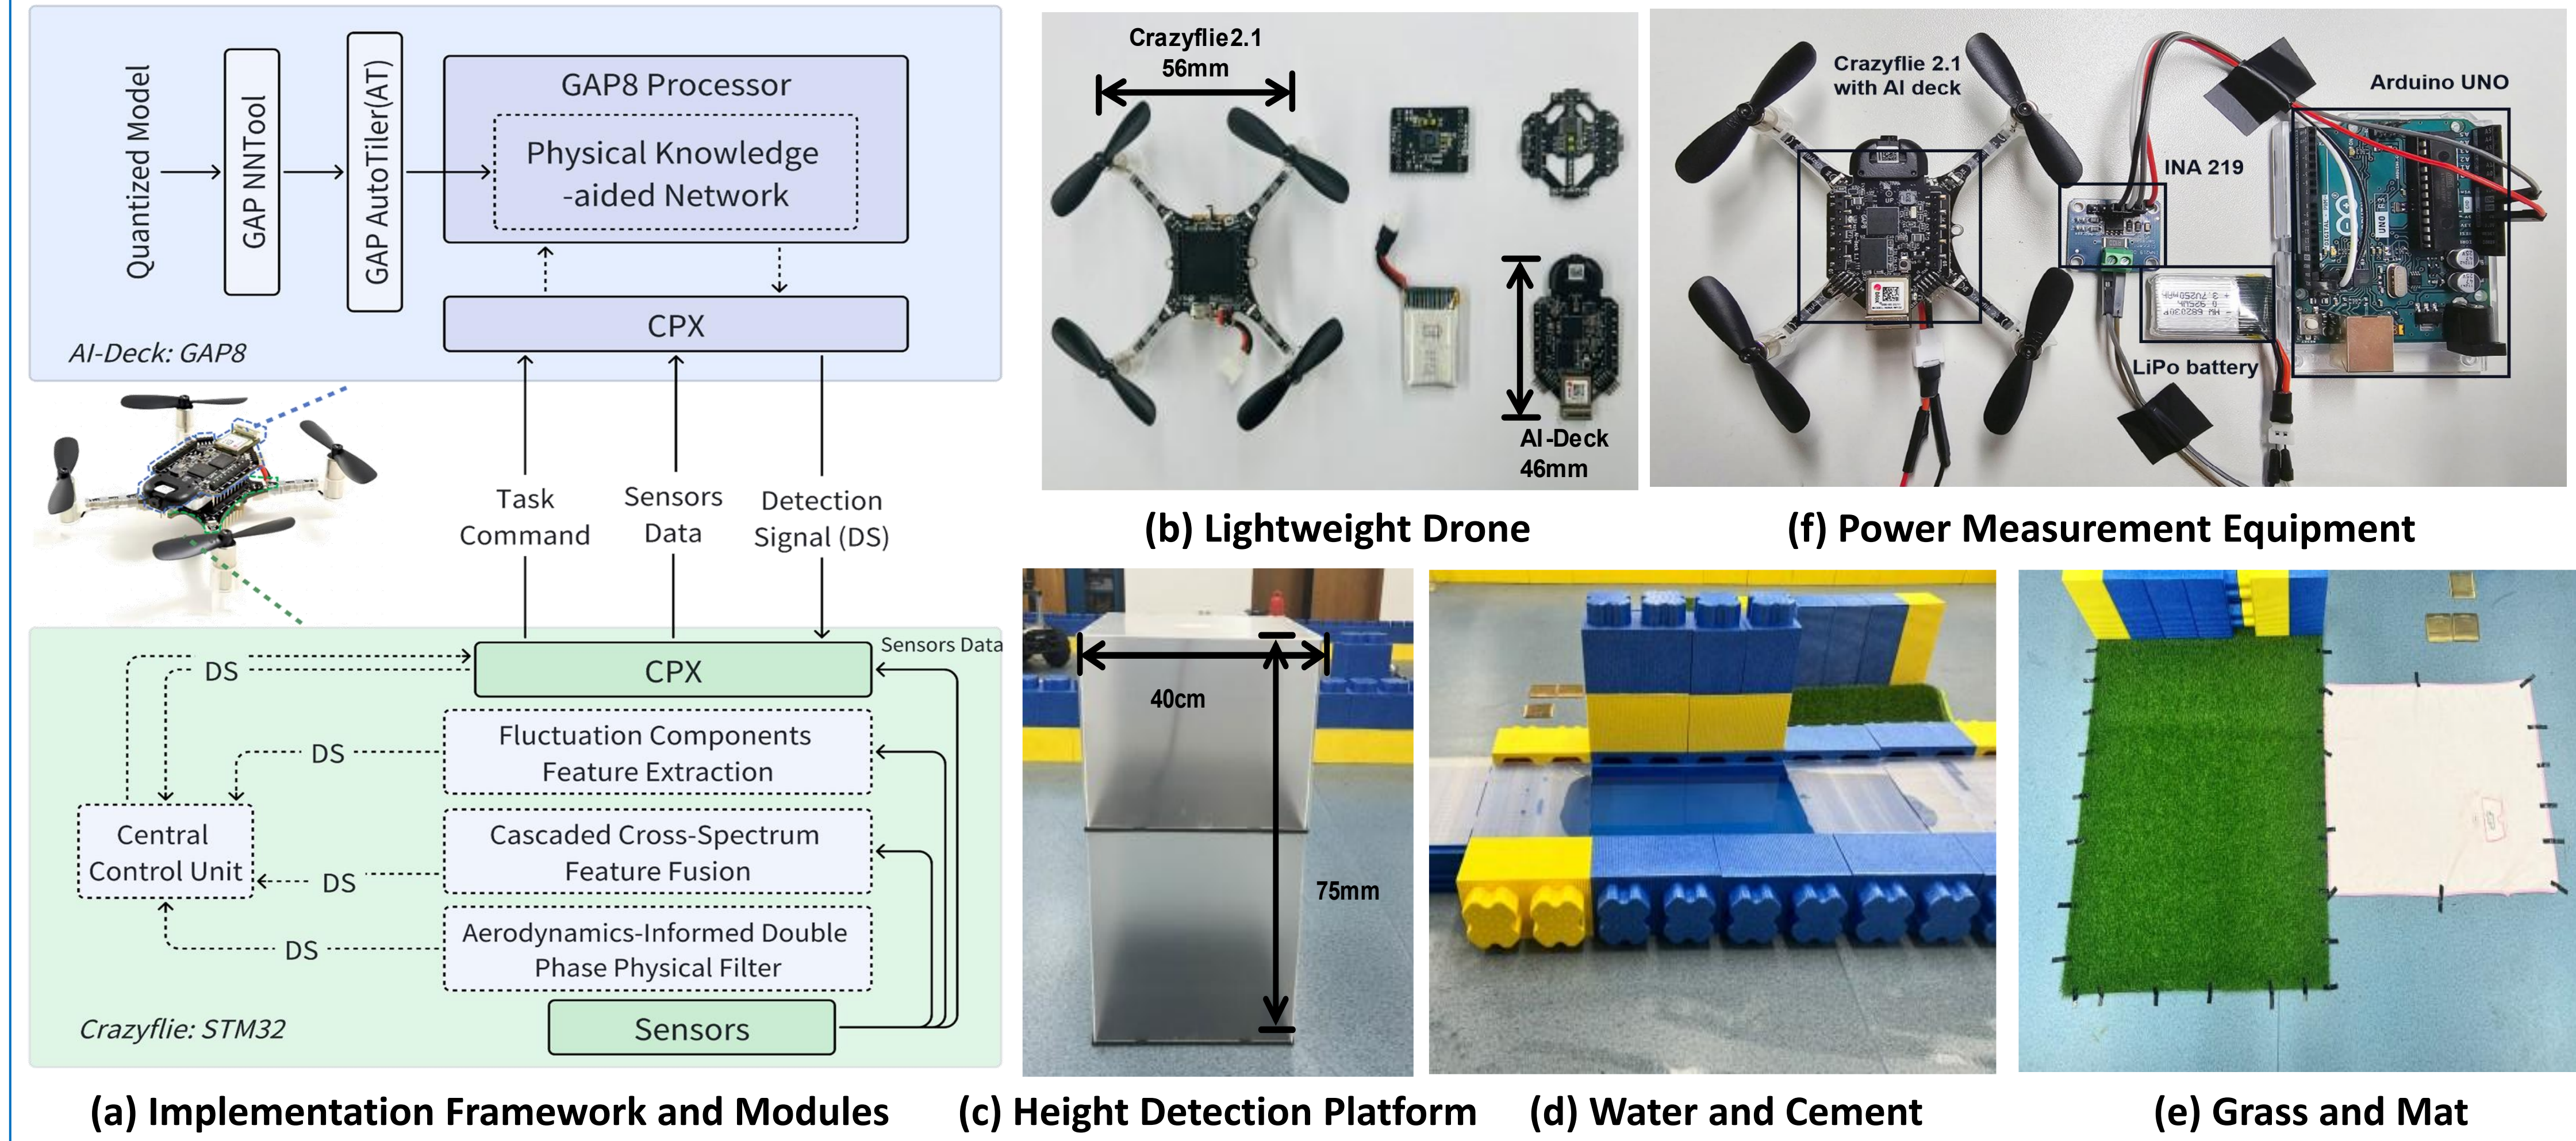

## System Design

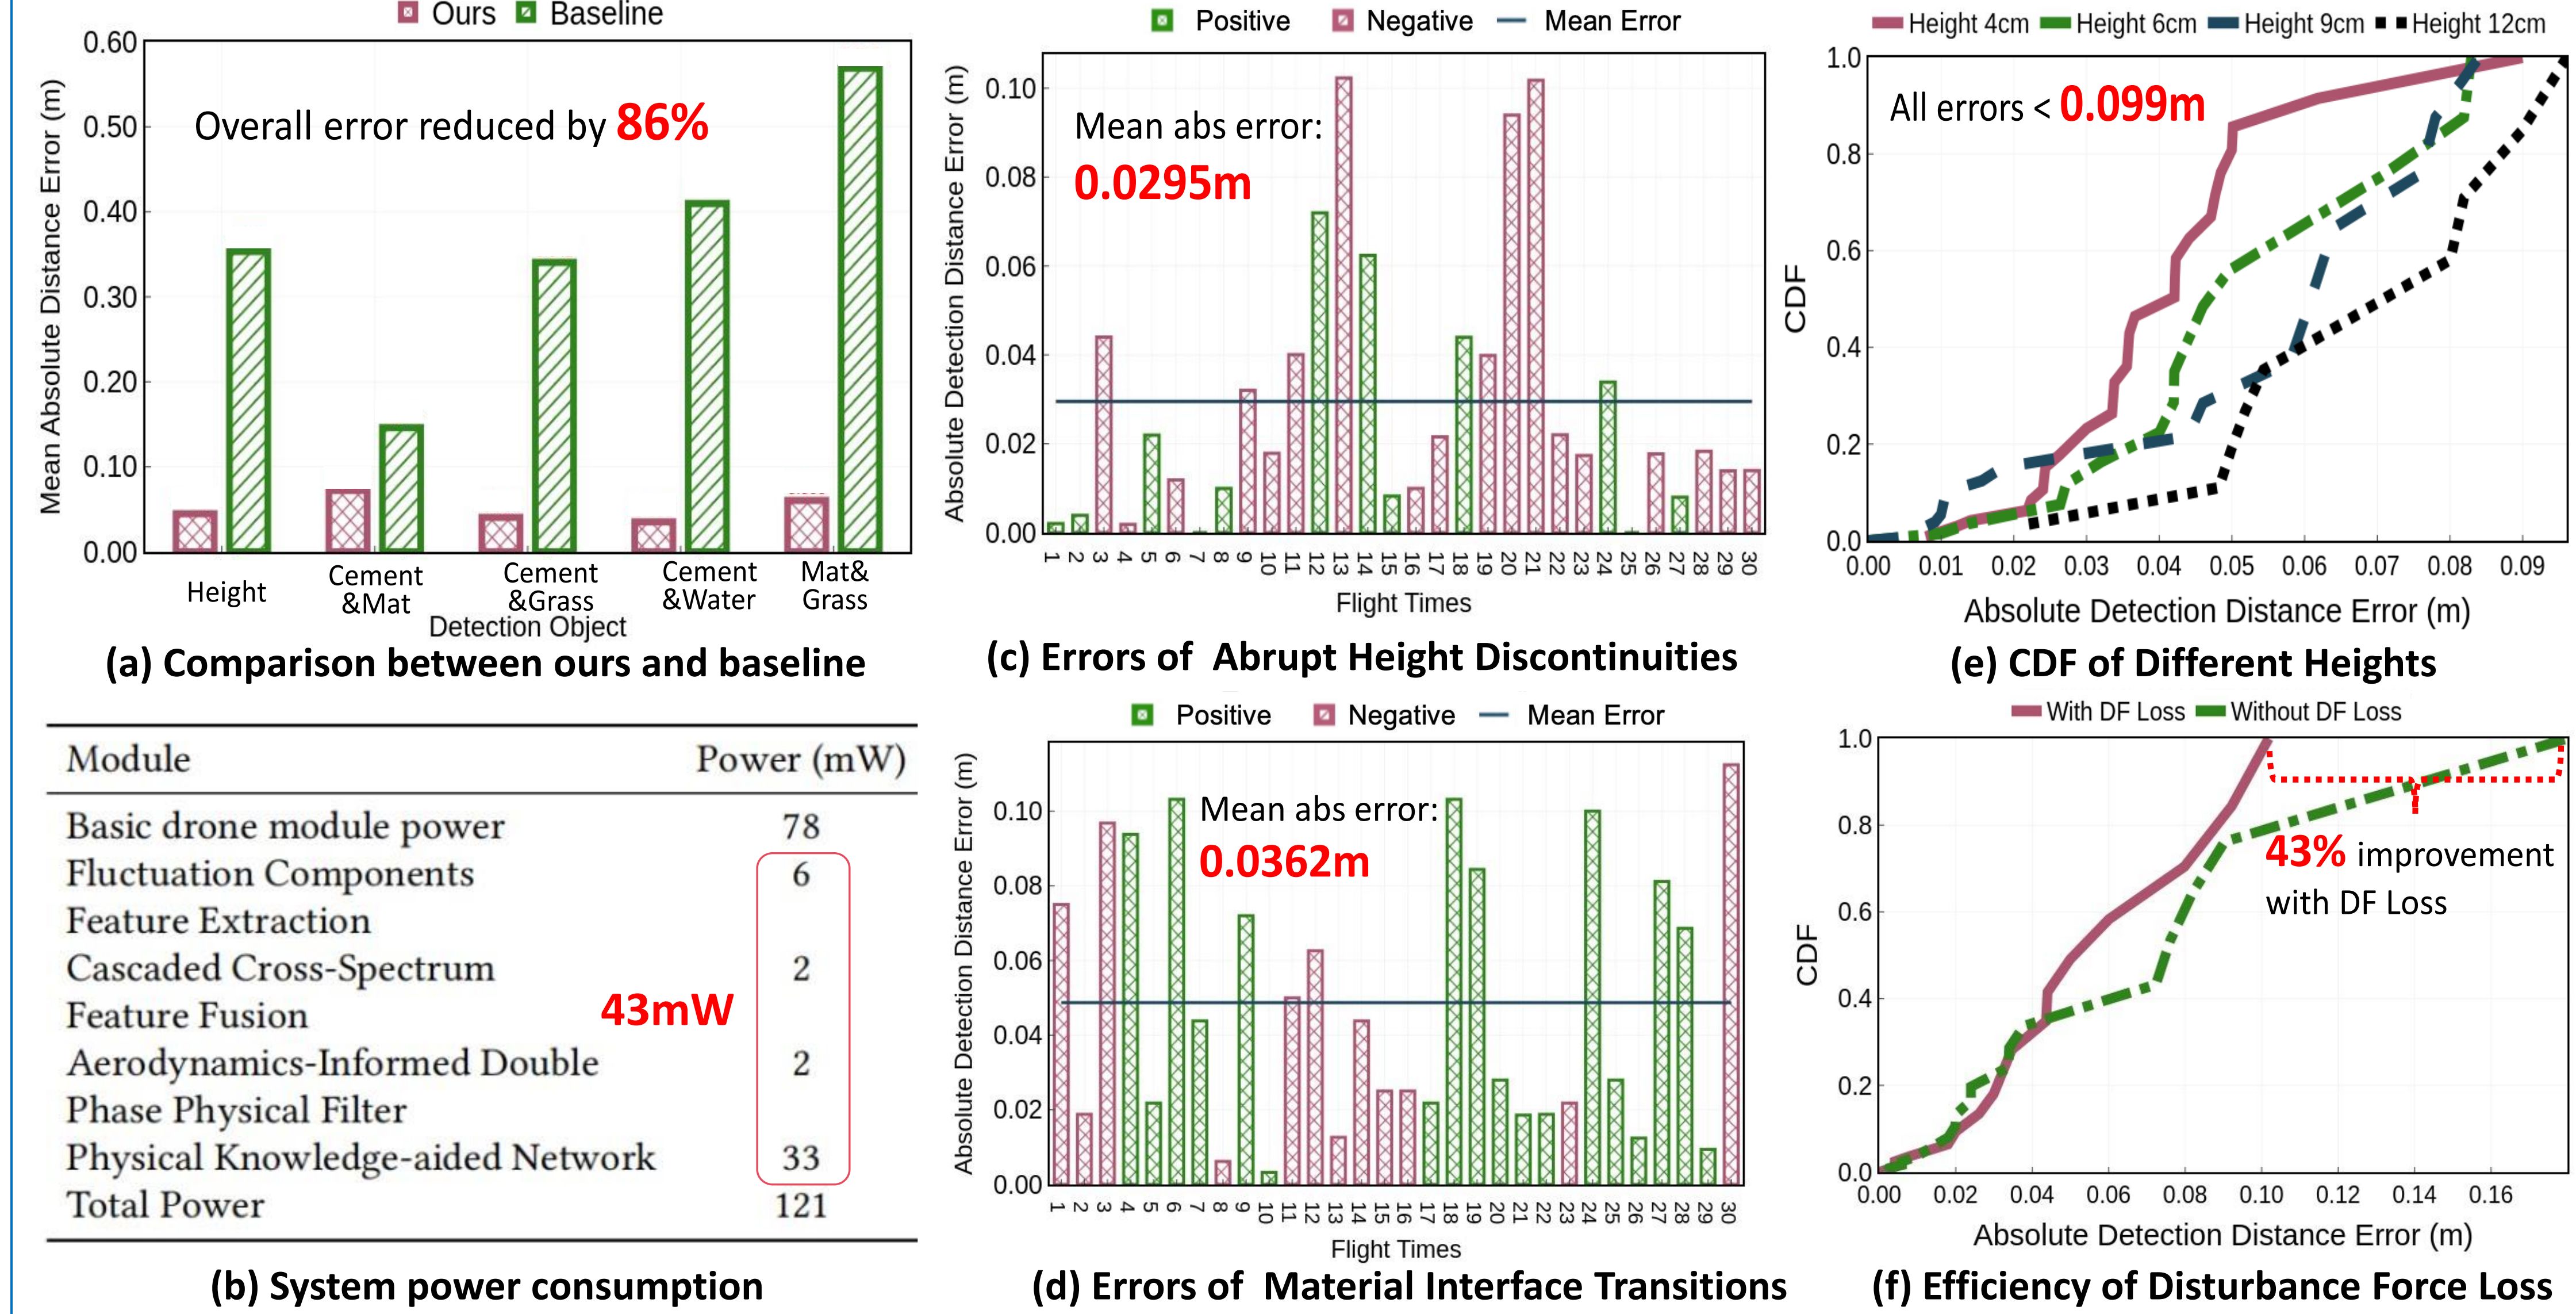

## Performance

### Experiment Setup

### Evaluations Results

## Conclusion

- **AirTouch:** Transform ground effect into a positive sensing modality for precise edge detection on lightweight drones, enhancing drone capabilities across diverse environments.
- **Future Work:** Extend edge detection to mobile platforms for enhanced air-ground coordination and collaboration.
